Netherland Dwarf
Frosty

FROSTY – The surface color will show a uniform distribution of ticked hairs over the entire animal with the exception of eye circles, ear lacing, underside of tail, belly, inside the legs, and nape of the neck where white is expected. The ears and tail are frosted more heavily in the body. Ticking is acceptable in black, blue, chocolate, or lilac. Undercolor is to be light pearl to white. Nails should show pigment. Eyes – Any color but pink.

Faults – Lack of uniformity in surface color. Excessively dark color showing saddle shading.

Disqualification from Competition – Absence of ticking. Slate undercolor.

Note to Judges – *Juniors may have a very light haze but should show some color development, especially on the ears. Animals with heavier ticking may fade to a slightly darker undercolor. This should not be confused with slate.*
